

Frozen-anchor local updates across all sharp scenes

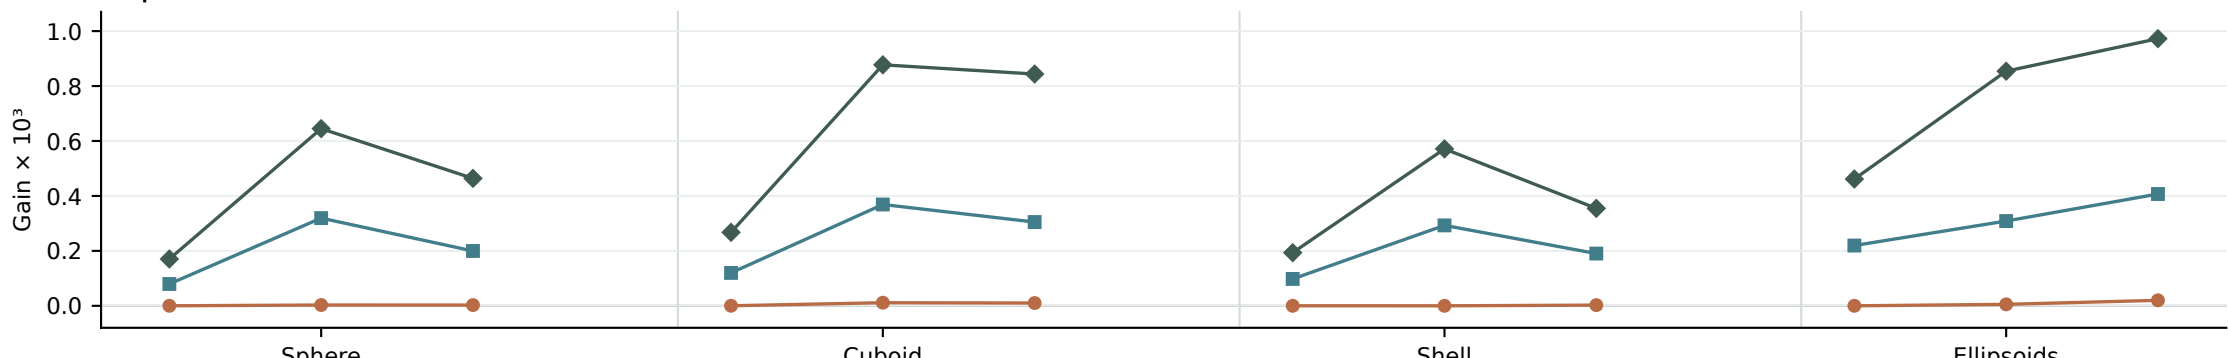

A | RESIDUAL candidate

B | GS candidate

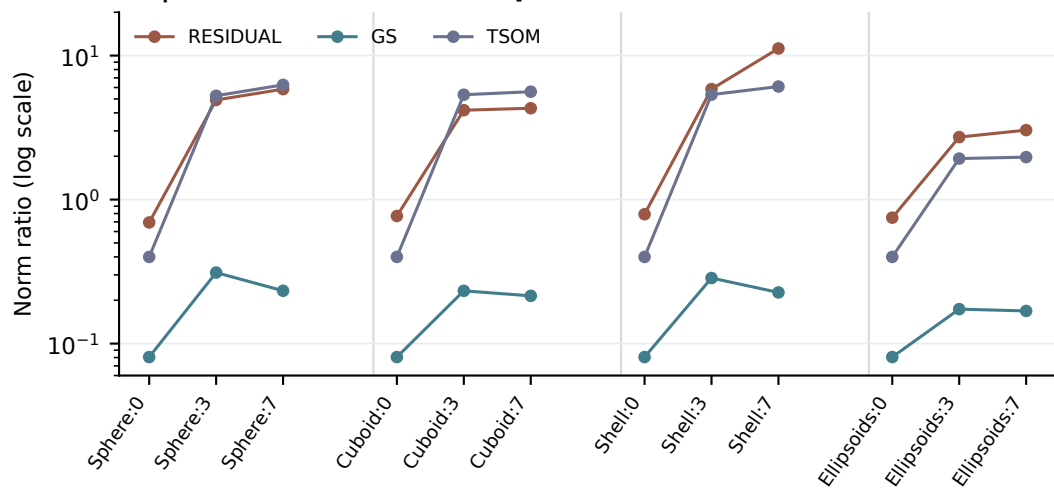

C | TSOM candidate

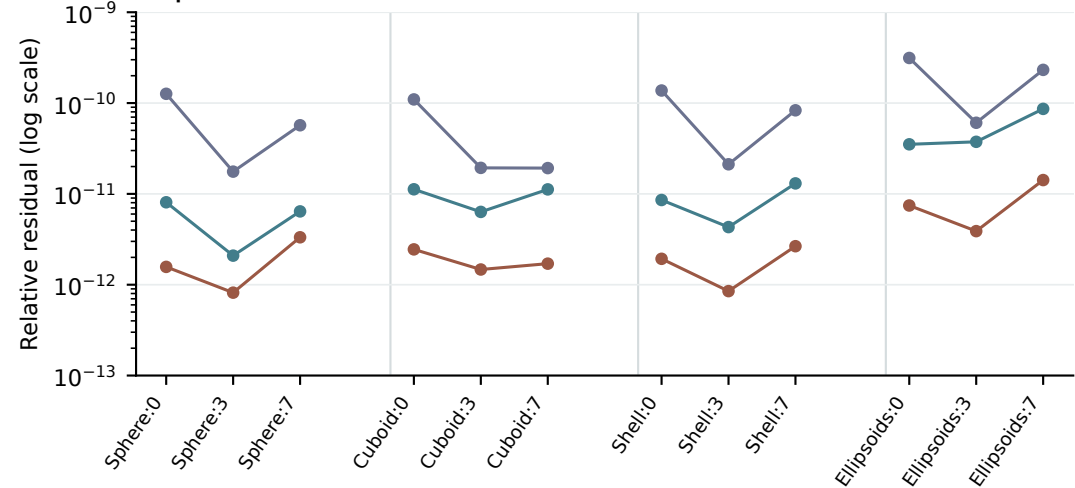

Sharp scene and frozen anchors 0, 3, 7 (left to right within each scene)

D | Feedback / direct output norm

E | Relative H-closure residual

Full-quadratic gain = base Φ - candidate Φ ; larger is better. Paired and Krylov each use real rank 48. Direct is the enlarged-current-model step. Lines connect anchors within a scene only. These are correlated local diagnostics, not independent trials or a runtime / nonlinear acceleration comparison.
